

Air

Air is all around us.

But we can't see it.

How do we know it is there?

There are many ways.

We can see what air does.

Moving air is called wind.

Wind moves plants.

Wind moves dirt.

Strong winds can move heavy things.

Strong winds can even move a house.

We can weigh air.

We can weigh two balloons.

The one with a lot of air weighs more.

We can see what air does.

We can weigh air.

Then we know it is there.
